Question
In what ratio does the point $(-4, 6)$ divide the line segment joining the points $A\,(-6, 0)$ and $B\,(3, -8)$?
Solution: Let the given point divides the line segment AB in a ratio k:1.

Variable	Description
C	Given point
k	The ratio in which the given point divides the line segment

TABLE 0: Variables Used

using section formulae:

$$C = \frac{A + kB}{1 + k} \tag{0.1}$$

$$\implies k = \frac{(B - C)^T (C - A)}{\|B - C\|^2} \tag{0.2}$$

$$k = \frac{\begin{pmatrix} 7 & -14 \end{pmatrix} \begin{pmatrix} 2 \\ 6 \end{pmatrix}}{49 + 196} \tag{0.3}$$

$$k = \frac{-2}{7} \tag{0.4}$$

$$\tag{0.5}$$

But,this doesn't match with the answer that came out by general method and it follows as:
distance AC= $\sqrt{40}$
distance BC=$7\sqrt{5}$
from above data the value of k is :
k=$\frac{\sqrt{40}}{7\sqrt{5}}$
So, the given point doesn't lie on the line joining the points AB
